What's New In Virtual CD-ROM Control Panel?

Virtual CD-ROM Control Panel is a simple, free and portable application that allows you to create a virtual CD drive on your hard drive so you can access it by just double clicking your mouse. It lets you create any amount of virtual CD drives and perform all of the actions required to open a physical CD. Homepage: How to use Google App Engine Objectify to update a property? I'm having trouble updating the property of an entity using Google App Engine and Objectify. I have a PersistentEntity in my DAO that looks like this: class Product(db.Model): value = db.StringProperty(default=0) cost = db.IntegerProperty(default=0) quantity = db.IntegerProperty(default=1) The user will update the product when creating a new one. I want to be able to use Objectify to update a property when the user updates it. Here's a snippet of my code. entityManager.persist(product); This creates the product entity, but I want to also set the cost and quantity properties so that the product's properties get updated. I can't seem to figure out how to use Objectify to do this. Thanks! A: It's more a matter of where you put the update operation, i.e. you can either do it as a generic EntityManager operation like the persistence version shown above, which would be the best, but can get a bit messy with updates to single entity types, because Objectify doesn't know that you want to save any changes of that particular entity, it just collects everything, and then you could try and get the current entity instance and make some changes to it to save it, but that gets quite hairy to handle. Alternatively you can explicitly get the instance using get(entityId) or get(key) and do the update operation there. This is probably your easiest route. // Copyright (c) 2014-present, Facebook, Inc.
