What's New in the?

Do you like to see vortices? It's an amazing natural phenomenon of a spinning vortex, which is created by an angular rotation of a thin film or liquid, which radiates high-frequency waves, called waves, from the near-surface layers. If you have a microscope or a camera and see, these are thin liquid films, it's enough to look through a microscope at a point where there is a thin film on a glass, and you can observe it. Note that high-intensity visible light, are the waves, which are high-frequency movements of the

liquid, creating a screen of interference pattern. If the screen is viewed through a closed loop, the waves never reach the opposite surface and ultimately they cancel each other. The thickness of this screen is an order of magnitude greater than the wavelength of the light, so it does not affect the color of light, but it's still a very thin film on the glass. Just as an analogy, you can imagine, the thickness of a paper screen, which you can see with your eyes. When a flapping or flying aircraft passes through a wind tunnel, it creates a twisting shape of the streamlines that appear in the air behind the aircraft and on its bottom. In the case of a vortex, at the entrance to the vortex, the rotational speed is maximum and the movement of the liquid is parallel to the axis of the vortex. The thickness of the thin film on the glass in the example above is the diameter of a particle of a liquid, and if this diameter is a tenth of the wavelength of light, then the size of the particles in the thin liquid film is within the range of a few hundred millionths of a millimeter. It's enough that the liquid film be in the neighborhood of a few thousand times thicker than a micron of thickness. The same is true if the vortex is formed by the flow of liquid along the surface of a globe. If the globe is smaller than the wavelength of light, then it looks like a vortex, you must look at the center of the vortex on a globe of the Earth. The same time, the pattern is rotating with the axis of the rotation, but the surface of the globe, viewed from the vortex, it's shaped like a roller coaster. If the globe has the diameter of a few thousands of kilometers, then the size of the particles

forming the vortex in the center of the vortex is in the same range as the diameter of the Earth
