Retinoic acid (RA) is a member of the steroid family of natural compounds that have been used as a drug for treating some skin diseases. However, the precise mechanism of action of this drug is not yet clear. Some works have reported that RA can mediate its effects by regulating the activities of nuclear receptors, such as retinoic acid receptors (RARs) and retinoid X receptors (RXRs). It is possible that RARs and RXRs may also have a role during cutaneous wound healing because they control processes such as fibroblast growth and keratinocyte differentiation. This study used immunohistochemistry and receptor-specific antibodies to localise and characterise RARs and RXRs in the epidermis of the human foot during normal skin and healing. It was found that the basal and spinous layers of the epidermis expressed RAR-alpha, RAR-gamma, RXR-alpha and RXR-beta. All RARs and RXRs were expressed in some keratinocytes. Some stromal fibroblasts, macrophages and cells with polymorphonuclear cell morphology were also stained for RAR-alpha, RAR-gamma and RXR-beta, while RAR-gamma and RXR-alpha were found to be expressed in many mast cells and macrophages. The messenger RNA (mRNA) levels of RAR-gamma, RXR-alpha and RXR-beta were determined in the epidermis by RT-PCR. The mRNA levels of all three receptors were increased in the epidermis during normal skin and healing, with the largest increase being for RXR-alpha. Immunohistochemical studies have shown that RA receptors are not only located in the nuclei of the cells, but are also present in the cytoplasm of epithelial cells and fibroblasts.The present invention relates to a method for manufacturing semiconductor devices that includes a process for forming an epitaxial film, and more particularly to a method for forming an epitaxial film having
